

Volcano plot showing differential gene expression between iPSCs and iNeurons. The x-axis represents the log2 fold change (log2FC) of iPSC / iNeurons, and the y-axis represents the negative log10 of the adjusted p-value (-log10(padj)).

Red dots indicate downregulated genes (log2FC < 0), and blue dots indicate upregulated genes (log2FC > 0). Genes are labeled with their ENSG IDs. A dashed horizontal line at y=0 indicates the significance threshold.

Key labeled genes include:

- ENSG00000149294
- ENSG00000102109
- ENSG00000185885
- ENSG00000240563
